AI Automation & Software Toolkit

10 AI workflows, spreadsheet automation, business scripts, no-code templates, and browser tools — in one kit.

Stop doing the same task by hand every day. This toolkit gives you ready-to-use AI workflows, spreadsheet automation, tested Python scripts, no-code templates, and browser tools — everything a small business needs to automate the repetitive work and keep the creative work for yourself.

No software to install beyond Python (for the scripts) and a browser. Every script was run and tested before shipping; every prompt was written to be copied, pasted, and used.

Tier	Price	What is included
Starter	$19	Full guide + 10 AI workflow prompt packs + browser tools
Professional	$49	Starter + 2 spreadsheet workbooks + 4 Google Apps Script snippets + no-code templates
Premium	$99	Professional + 5 Python scripts with sample data + 3 worked examples + checklist + fillable worksheet + 50-prompt bonus library + decision sheet

How to use this guide

Start with the Quick Start sheet (15 minutes, one automation running). Then pick your next automations with the audit checklist and the worksheet. Each chapter is independent — read them in any order.

1 The 10 AI workflows

Each workflow lives in the **prompts/** folder as its own file: the problem, what you need, copy-paste prompts, steps, tools, and an honest note on time saved. The prompts work with any AI chat tool (ChatGPT, Claude, Gemini — free tiers are enough).

#	Workflow	What it does
01	Content repurposing	One post becomes 5 social posts, a newsletter section, and a video script
02	Email triage	Sort the inbox into 4 groups and draft the replies
03	Meeting notes to tasks	Notes become a task table with owners and deadlines

#	Workflow	What it does
04	Research summarising	Long articles become a 250-word summary plus actions
05	Social scheduling	One weekly theme becomes 5 planned posts
06	Customer reply drafting	A reply bank for common questions, plus drafts for new ones
07	Invoice chasing	Friendly reminder at 7 days, firm follow-up at 30 days
08	Lead qualification	Score enquiries before you spend 30 minutes on a call
09	Weekly planning	A realistic weekday plan from your top 3 goals
10	File organisation	A naming rule and folder map, plus the scripts to enforce it

Rules for every workflow

- Read the output before you use it. AI can garble names, numbers, and dates.
- Never paste passwords, bank details, or private customer data into an AI chat tool.
- Never auto-send AI drafts to customers. The draft is a starting point, not the send button.
- Time-saved notes are honest estimates for a typical small task — your results will vary.

2 Spreadsheet automation

Business_Automation_Dashboard.xlsx — Tasks, Invoices, and a Summary sheet with live formulas. Replace the sample data with your own; the Summary updates itself (total tasks, done/open, minutes tracked, invoiced, paid, outstanding).

Profit_Calculator.xlsx — edit the yellow cells (orders per month, price, other revenue, other costs). Gumroad fees use the direct-sale rate: 12.9% + $0.80 per order. The Scenarios sheet models 10, 20, 50, and 100 orders per month.

Google Apps Script snippets (.gs) — paste into Extensions > Apps Script in Google Sheets. Each file explains its own setup at the top: auto-sort a sheet, highlight duplicates, email a daily summary of open tasks, and refresh a dashboard sheet. They only run inside Google Sheets.

3 Business automation scripts

Five Python scripts in **scripts/** (Python 3.8+, no paid software). Full setup steps are in **scripts/README.md**. Two safety rules are built in: the renamer and the organiser run in dry-run mode by default — add **--apply** to change anything — and the cleaner never modifies its input file.

Script	What it does
bulk_file_renamer.py	Rename files to PREFIX_001.ext, PREFIX_002.ext, ... (dry-run by default)
csv_cleaner.py	Strip whitespace, drop empty rows, remove duplicates, normalise dates to YYYY-MM-DD
invoice_pdf_generator.py	One PDF invoice per row of a CSV (needs reportlab)
folder_organiser.py	Sort files into Category/YYYY-MM subfolders (dry-run by default)
daily_report_generator.py	Build a Markdown daily report from an activity-log CSV

Each script was run on the sample data in **scripts/sample-data/** before shipping. Expected outputs are documented in the worked examples.

4 No-code templates

Import-ready structures for tools you already use — not official integrations. The **no-code/README.md** has step-by-step import instructions (about 10 minutes each): a Notion-style Business OS (CSV databases + Markdown pages), an Airtable-style base (CSV tables + field guide), and a Trello-style board (CSV + JSON structure). All sample rows are fictional.

5 Browser productivity tools

Three bookmarklets (drag to your bookmarks bar — see **browser/bookmarklets.html**) and one userscript (**copy-as-markdown.user.js**, install with Tampermonkey, press Alt+M on any page). They run entirely in your browser; no data leaves your computer.

- **Copy page as Markdown** — title + URL as a link, plus selected text as a quote.
- **Text counter** — words and characters of your selection (or the whole page).
- **Tab title cleaner** — strips the site name from the tab title; run again to restore.
- **Copy as Markdown (userscript)** — same as the bookmarklet, on the Alt+M shortcut.

6 Worked examples

Three end-to-end examples in **examples/**, built from real runs of the tools in this kit:

- **CSV cleaner** — a messy client list (8 rows) cleaned to 5 rows: 1 empty row and 2 duplicates removed, dates normalised.
- **Invoice generator** — 3 invoices from one CSV (Acme Cafe $11.00, Budi Studio $49.00, Citra Bakery $6.50), with the maths shown.
- **AI workflow** — one blog post repurposed into 5 social posts, a newsletter section, and a 60-second video script in about 10 minutes.

7 Pick your first 3 automations

Do not automate everything at once. Run the audit checklist, then use the worksheet to pick three: one that saves the most time, one that removes the most annoyance, and one that gets you paid faster. Set them up this week; add more next week.

FAQ

- **Do I need to know how to code?** No — for the workflows, spreadsheets, and no-code templates. The Python scripts need only copy-paste commands from scripts/README.md.
- **Do the scripts work on Windows and Mac?** Yes — Python 3.8+ runs on Windows, Mac, and Linux. The commands in the setup guide work the same everywhere.
- **Can I use the templates for client work?** Yes — for your own business and client projects. You may not resell or redistribute the files as-is (see LICENSE.txt).

• **Do the AI prompts send my data anywhere?** The prompts run in whatever AI chat tool you choose. Never paste private data into them.

• **Are the scripts guaranteed?** No — they are provided as-is, without warranty (see LICENSE.txt). They were tested on the sample data before shipping, and every script has a dry-run mode where it makes sense.

Sources & notes

Market context in this toolkit is drawn from the Gumroad Market Data 2026 dataset (github.com/Pinous/gumroad-market-data, CC BY 4.0, updated March 2026, 146,271 products across 43,884 sellers). All revenue figures from that dataset are **estimates**, not verified sales. The dataset estimates the Software Development category at $65.8M revenue across 1,083 products (average price $39.95, average 293 sales per product). Price-tier data from the same dataset shows the $30–$49.99 band as the highest-sales band at a solid price. Time-saved notes in the workflows are honest estimates for typical small tasks, not measured results.

AI Automation & Software Toolkit — Premium tier $99 / Professional $49 / Starter $19. Built for small businesses that want their time back.
